Week 1

Reading

R.1

Following is a small summary of the text. Notes that I have taken during reading can be found on google Drive in the Notes folder.

Summary: The mind operates using two systems. System 1 operates quick and automatically, while system 2 is used to answer more complex questions/activities and monitor system 1. System 2 is also in charge of judging and unbelieving, but does this based on the information given by system 1. The problem can be however that system 2 is very lazy and lets system 1 do most of the work, only interfering when either the question is too difficult or the quick answer generated by system 1 turns out to be insufficient. System 1 operates using heuristics. Heuristics are methods of finding answers that are adequate but often imperfect. One example of problems caused by heuristics are visual illusions.

R.2

Following is a small summary for each of the papers read. Notes that I have taken during reading can be found on google Drive in the Notes folder.

Software Requirements and Specifications: Building software is like making a machine. The parts that will be interacted with is the application domain. In general developers tend to combine the requirements for the application and the machine. This is however often problematic because in most cases the developers will only focus on the machine part. The author states that the requirement of the application domain should be defined separately and explored extensively. The author also states that the evolution of development methods has been harmed because the idea is created that there is a single best method of development.

Contextual Design: Contextual design is a design approach in which the designer is involved in all step. This also includes tasks like data collection. This helps the designer to get to know what is important for the customer. The designer should start with interviews, and focus on interviewing all types of people in the process, and not just the experts. These interviews should be combined into consolidations. These consolidations should then be shared with all people that could provide with good feedback. Another important thing is to redesign the workplace. During this process it is decided what technology is essential for development. Another suggestion is the creation of An User Environment Design (UMD), which shows each part of the system and all interactions with them. Lastly, the author states that it is important to iterate a design early and often. A good way to do an initial test is to use paper prototyping.

Setting the Scene: To make sure that software solution correctly solves a particular problem, we must first understand the problem. The aim of a software project is to improve the world using a machine. In a machine-building project, our business as requirements engineers is to investigate the problem world. There are two versions of this world: System-as-is, the system that exists before the machine and System-to-be, the system when the machine is done.

A problem can be structured into three dimensions. The first dimension is why. The why dimensions focusses on defining what the problem is that the machine is going to alleviate. Common actions in the why dimension are the following:

- Acquiring domain knowledge
- Evaluating alternative options in the problem world
- Evaluating technology opportunities
- Handling conflicts

The second dimension is what. This dimension is concerned with the functional services that the system-to-be should provide. This part should be defined precisely and should be written in such a way that all parties understand fully.

The third dimension is who. This dimension defines who of the staff is responsible for specific tasks. Decisions about responsibility are vital for a projects success.

TaskModeling: Traditional functional requirements specify the system's role but ignore the context. This is unsuitable because it prematurely divides work between the computer and the user. The author suggest making a work area description, which states formal requirements and overall purpose. The author states that it is very important to determine what are separate tasks and what are subtasks. This will provide a much better overview of the systems essentials and structure. A good systematic way of expressing problems and solutions are tasks and support descriptions. These descriptions combine subtasks and potential solutions.

R.3

Sensemaking is the process through which people work to understand issues or events that are novel, ambiguous, confusing, or in some other way violate expectations [7]. Sensemaking is a critical organizational activity. For top managers, sensemaking activities are key tasks that significantly influence organizational decisions[6]. Maitlis states that methods of sensemaking can be divided into four distinct forms: guided, fragmented, restricted and minimal. [6].

The first type of sensemaking is Guided sensemaking. This type is highly controlled and highly animated. In guided sensemaking, the stakeholders had a high level of engagement due to many organized controlled discussions. This results in higher knowledge of the issues.

The second type of sensemaking is Fragmented sensemaking. This type is animated but not controlled. This is similar to guided sensemaking with the stakeholders still being very involved, but without controlled discussions.

The third type is Restricted sensemaking, This type is very controlled but not animated. This is similar to guided sensemaking but instead of involving all stakeholders, only a few specific stakeholders are involved.

The last type of sensemaking is minimal sensemaking. This type is neither animated or controlled. This meant that all parties in the organization kept to themselves and only conclusions were shared between them.

R.4

Online education is getting more and more important. In 2013 already 33.5% of student were enrolled in at least one online course [1]. Another factor which makes online education so important is the global pandemic caused by the corona crisis. While online education is often seen as inferior to offline learning, it has some advantages. Examples of advantages are the increased access of courses for students that live far away and the alleviation of capacity constraints due to room sizes[9]. Online learning is however not only positive. Examples of problems are teachers feeling less able to retain student attention, students requiring more discipline to succeed and the loss of social interaction[1].

What the ideal online course should look like is difficult to describe but I will try to define what I think are important factors for a good online course based on a small study, interviews with other students and my own experiences. From the interviews as well as my own experiences I conclude that structure is very important for online courses. Because online courses require the student to work more on their own it is important that the student should be able to get a clear idea of what is expected without much interaction. The second important factor in an online course is the tools that are used and how well a teacher uses it. A research into the success of online learning[9] states that lecturers should adapt their lessons to make optimal use of the online tools available. Most importantly is focussing on the interaction with students. A research on the satisfaction of online education in China during the pandemic[4] states that the biggest factor of satisfaction for students was the quality of the tools used.

As a conclusion, I think that the success of an online course is dependent on how well the tools to give an organized and structured course. I think it is also important that the lecturer focusses on the interactive parts of his lectures.

Exercises

E.1

A small presentation on online learning can be found in my Drive

E.2

My favorite interviewer is Louis Theroux. What I admire about Theroux is his ability to interview so many types of people. I think the reason he is so successful is that he makes his interviewees feel very comfortable. One of the reasons I think he is able to do this is because he seems very unjudging and passive. Even though he might not look or act very daring, I think it is that kind of atmosphere that allows him to get away with asking questions that might be too extreme for other interviewers to ask without any bad responses. These things make it possible for him to interview people that don't want to be interviewed by other people.

Another thing I like about Theroux is the type of questions he asked. Most of his questions are very simple, but his interviews still result in very interesting conversations.

An example of Theroux getting away with asking something bad is in the following clip: <https://www.youtube.com/watch?v=wU02MBKICiE>. Theroux is talking to the Phelps family, one of the most extreme religious people, and at 3:30 suggests that the mother might not actually believe what she is saying.

What I hope to emulate from Theroux is to also create a comfortable environment and ask simple but good questions.

E.3

The recordings of my interviews can be found on Drive in the interview folder. Following are what I found to be the most interesting thing from the interviews. After this I will reflect on the interviews.

Clement Julia: Clement does not have any experiences with online learning so far. This made it more difficult for us to talk specifically about online learning. Instead we discussed what he finds important for courses in general. Clement stated that structure in lectures is very important. An example he gave to reach this is by having a clear first slide which shows what will be discussed in the lecture and how this is connected to the rest of the course.

Lucas Steehouwer: Lucas has experience with online while he was doing his previous master last year. For Lucas it is important that courses have practical elements that are connected to the theoretical part. Lucas did not enjoy the online courses he had followed last year. Lucas stated that this was mostly due to motivational issues and unclear course structure. Lucas thinks that we are currently focussing too much on simulating the offline learning environment in an online setting. Lucas questions if this is the best way to get to ideal online education.

Jelle Witsen Elias: Jelle did not have any experiences with online learning so far. Interestingly, Jelle does not have a background in computer science but in law. This meant that the focus of the interview was more on his experiences with offline learning and how he thinks this will transfer over to an online platform. Jelle stated that motivation is an important part of a course for him and that teachers should focus on this part. Jelle thinks that in an online setting it is even more important for the teacher to interact with the student.

Reflection: I think that the interviews turned out decent but I do have some points I think I should improve on. The main thing is that I felt that the three interviews resulted in very similar answers. This is because I felt that the interviews stayed very surface level, and did not explore the subject enough. Another point of improvement for me is ending the interview. I did not really know when to end the interviews. A possible way to fix these problems is to prepare better questions and define my goal for the interview better.

E.4

I have reviewed the interviews of Ivan Venio. In my review I will mainly focus on how the interaction with the interviewee is, what kind of questions you ask and if you can get all the information out of the interview that you might want. I will start with my overall impressions and follow it up with some snippets which I found interesting. The interviews can be found using the following links:

David: https://www.youtube.com/watch?v=fLVJzaw_s0U&feature=emb_title

Wilco: <https://www.youtube.com/watch?v=W6CUbnptKhY&start=135s>

Joachim: <https://www.youtube.com/watch?v=7HV3gSq9D1c>

My general impression of Ivan's interviews are very positive. The interviews flow well and everyone seems to be very comfortable. I like how Ivan managed to get much information out of the interviewees with few questions. I also liked how Ivan was reacting to the answers and turning them into new questions. The only problem I have with the interviews is that they felt somewhat short, especially the interview with David. Another small problem I have is that Ivan sometimes summarizes the answers quite extensively which can effect the flow of the interview. All in all I enjoyed the interviews.

snippets

David: 2:54 good continuation of his answer into a new question

Wilco: 2:35 good continuation of his answer into a new question

Joachim: 2:16 Joachim just tanked about his hard times with being motivated in the first few lessons. A good follow up question here might be if he has any suggestions on how to fix this problem

E.5

For the overview of Corona apps we have made a google Drive file located at https://docs.google.com/document/d/1u6IUTjyClg6BgeTiaZAXrhK2G_hl9F87RY0gBVDjTw4/edit#heading=h.r3e7ka7zotug

Week 2

Reading

R.1

Following is a small summary of the text. Notes that I have taken during reading can be found on google Drive in the Notes folder.

Summary: People are not great in handling statistics. System 1 cannot properly understand statistical facts, which leads to many bad conclusions. Extreme outcomes are more common when dealing with smaller samples. People often tend to create patterns in random events, because system 1 prefers certainty over doubt. This creates what is called the law of small numbers. Small probabilities are handled by people in two ways: either they negate them, or they value it way to strongly.

People use other numbers to anchor to, even when these numbers are not related. anchoring means that the answer to a question is similar to another number, this number is the anchor. While anchoring is something done by system 2, it still inherits the biases of system 1.

People have biases when judging situations. For instance stating what is a higher cause of death is very difficult. Another problem with the human mind is the that we have difficulty understanding probability. An example of this is Linda, a woman who can either be a "bank teller" or a "feminist bank teller". The second is a subset of the first, so the first is always the correct answer. This is however not how all people answer.

When dealing with probability people also tend to give much more weight to specific information about a case compared to the base rate. A good way to not fall into this is to first set a base rate by making an average assumption and then deviate from this assumption using the given information.

R.2

Following is a small summary for each of the papers read. Notes that I have taken during reading can be found on google Drive in the Notes folder.

Apprenticing with the Customer: In this paper the author discusses the use of a master apprentice relationship for the designer. This type of relationship works well because it does not require the costumer to be an expert at explaining himself. This method should lead the designer to have a better understanding of the situation he is building software for.

R.4

What Great Listeners Actually Do: People often think that they are good listeners, but this is mostly false. To be a good listener one should ask good questions, include interactions that build self-esteem, creat a cooperative conversation and make good suggestions.

R.6

Being a good listener is more than just being quiet and occasionally ask a question. Zenger and Folkman state that a good listening is a process in which the listener engages in the conversation by periodically asking questions, making interactions that build the speakers self-esteem and making good suggestions [10]. Methods of becoming a better listener are clearing away distractions like phones or trying to observe nonverbal cues, such as facial expressions. Grohol adds that methods to show that you are actively listening include summarizing, paraphrasing or reflecting on what the speaker just said [5]. Aside from only being a good a good listener it could also show the speaker what parts of the story where not clear enough. This could cause the speaker to elaborate on what he just said. In this paper Grohol also states that it is better to ask for elaboration in a friendly matter, if your reply is questioning their answer too much, it can make the speaker defensive. Grohol also states that asking for an example when an example can make the speaker elaborate on their point. This is similar to tactics described by Beyer and Holtzblatt, who states that a designer should ask simple questions and focus on examples because you cannot expect a costumer or interviewee to be able to answer questions in abstract form [2].

R.7

As stated in *R.6*, there are many ways of being a good listener and ensuring an environment in which the speaker feels comfortable and easy to talk in depth about the questions at hand. There are however also some thing that are best to be avoided if one wants to be a good listener. Beyer and Holtzblatt states in his paper that there are seven roadblocks which should be avoided [2]. Those roadblocks are the following:

1. asking to many "Why" questions. This can make the speaker defensive
2. Quick reassurances, like "Don't worry about that"
3. Advising, while sometimes appropriate, can also make for bad conversations
4. Digging for information when the speaker would rather not give it
5. Being patronizing
6. Being preaching
7. Interrupting the speaker

These things can all break the flow of the conversation and create an environment in which the speaker would rather be quiet.

R.8

Memorizing is an important human ability. I will discuss different techniques of memorization for the task of learning word vocabulary, but I think these methods could be adapted for much more tasks. In their paper, Oxford and Crookall look at the influence of memorization techniques for learning vocabulary [8]. The memorization techniques are classified into four groups: de-contextualizing, semi-contextualizing, fully contextualizing and adaptable.

The first group of methods is de-contextualizing. This means that the words are removed from context fully. Examples of this technique are word-lists or flashcards. This method is very common in high school education, but has several issues. The first issue is that students learn list of words for when they are tested, and forgets them immediately after. The other problem is that because of the lack of context students often create their own associations between words that are not valid at all.

The second group of methods is semi-contextualizing. Semi-contextualizing techniques allow some degree of context but fall short of full context. Examples of this technique are *word groups*, which means dividing lists of words into groups of similar meaning, and *word or Concept Association*, which means that new words are connected to already known words to provide context.

The third group of methods is fully contextualizing. Fully contextualizing focuses on embedding the new words fully in their normal context. Examples of this technique are reading and listening practice, using bigger stories, or speaking and writing practice. This method has the advantage that students will retain vocabulary just through reading practice and will make them more aware of context. The problem with this method however is that while students might be able to determine the meaning of a word in context, there is no guarantee that the word is completely learned or known.

The fourth group of methods is adaptive. The adaptive method reinforces the other techniques at the part of the contextuality continuum. The adaptive method entails going back to words that were already learned at different intervals. This constant repetition is key to memorizing words.

Memorizing is best done by combining different styles of techniques, both contextually and non-contextually. Frequent repetition of the task at hand is also important to create a good memory.

Exercises

E.1

E.2

E.3

For this week's interviews I will be talking with Lucas Steehouwer and Clement Julia. We will be talking about what types of jobs we want to get after our masters. Last week I felt that I did not go deep enough into the question as I would have liked. This is why this week I have made a more detailed plan of

action. The general plan for the interviews is the following:

First I will ask the interviewee about past jobs, what they liked, and what they didn't like. If they have done jobs related to our field of study I will ask them more elaborate questions about it. If they haven't done any jobs yet, or very little, I will skip this part and try to focus more on other parts.

In the second part I will ask if the interviewee already has an idea of a future job. If so, I will ask him to elaborate, and ask him how he knows this so sure.

The next part is talking about what the interviewee finds important for a job and why. I will also ask if the interviewee already has a goal for a job in the further future. I will also ask if he thinks the job he will take just after the master is different from what he will do later down the line.

I will end my interview with giving the interviewee a set of choices. Each will be a choice between two things for which I would like to know which one they prefer, how much they prefer it, and why.

The goal of the interviews is to get a good idea of the aspirations of the interviewees. Castillo-Montoya states in her research that during research interviews we should not ask pure research questions because they would overwhelm the interviewee [3]. This is why I will try to ask as little abstract questions, and end the interview with choice questions which will make the ideas more palpable. The step of making the process less abstract is what I got from the paper explained in *R.2*. The questions can be found on the drive.

Clement Julia: The first interview was done with Clement. Clement has worked for a big company full time as part of his bachelors. He enjoyed it and found that he had learned a lot from it. He did state that he did not like the amount of things he had to do that was not related to programming.

For the near future Clements states that he first would like to go to a smaller company and maby later transition back to a bigger company. Clement does not have solid plan for after the masters, just that he would like to work at a smaller company. It is important for Clement to have freedom in what to do, something he felt was lacking in his last job.

For the further future he expects to eventually go over to a larger company. Clement enjoys programming so he would like to be more technical than social in his work.

At the end Clement states that he would like to work at a startup rather than an established company because it will provide more freedoms. Finally Clement states that motivation is more important than money, given that the salary will still be enough to live on.

Lucas Steehouwer: My second interview was done with Lucas. Lucas did not have much work experience in the field of our study aside from being a TA during his bachelors. Lucas liked being a TA but not for the courses with bad organization.

Lucas has now good plans for a job after his masters for a job. He does not have things he really wants to do, but has some examples of things he would not like to do. Lucas explained that he started with the bachelor information science and later switched to computer science. He said he made the change because he did not want to become a consultant, which many information science students become. Lucas also states that he does not want to get involved with the financial world, because he thinks it is uninteresting and unethical.

Lucas states that he does not mind being at the same company for a long time because he likes the stability. Lucas also states that he would not want to work in a company that is too large since he does not like the organizational work it brings with it.

Reflection: I am satisfied with the interviews of this week. I think the interviews were better than last week. I think that the improvement was caused by a better plan beforehand. I do think that the plan could be improved even more. One of the things that I found was that some questions seemed to have the same purpose. This meant that the question was made redundant by the answer to a previous question. I think that focusing on what each question will add to the interview beforehand could improve the overall interview.

E.4

For this weeks review I have looked at Lucas Steehouwer interviewing Clement Julia. I will review the interview looking at the following elements:

- Are the base questions answered
- How deep is the interview diving in the subject
- How is the interaction with the interviewee

I would like to start with stating that I really enjoyed the interview. I think the interaction between the interviewer and interviewee seemed good and the interview had a good flow. One thing I was somewhat missing was a question if the interviewee had a certain aspect of coding in which he would really like to work. In general I think the interview worked very well. Next, I will list some timestamps which I found particularly interesting:

8:20 I really like this question because it gives us some insight and is a good reactions to what Clement has said during the interview.

7:10 Clement start talking about him wanting to still be relevant in 10 years time. A good question in my opinion would be to ask if he has a plan to make sure this is the case.

Ad Active listening

Ad Reliability of information you get ou of interviews
